

RAZORPAY AI BUILDATHON | TRACK 04

SettleMatch

AI Finance Controller for Razorpay Settlements

Build. Show. Get hired.

Product pitch deck | Features and story | No code

Rules first. AI second. Gate always.

01 | The Problem

Money arrives in two places

- Razorpay settlement list
- Bank statement credits

Finance teams still match them by hand

- Slow
- Error-prone
- Hard to audit
- Easy to miss missing credits

02 | The Opportunity

AI can generate answers fast. Finance needs something else: verification capacity.

"The question is not 'Can AI talk?' - it is 'Can AI close the books safely?'"

Track 04 (AI Finance Controller) asks builders to close one finance-ops loop on a 50+ record batch, with measured accuracy and an honest exception list.

SettleMatch closes one full finance loop

- Take settlements + bank rows
- Match them automatically
- Show match rate
- List what it could not resolve
- Keep a full audit trail

"One job. Done end-to-end."

04 | Product Promise

- Every match is explainable
- Every money-adjacent decision is bounded
- Ambiguous cases are refused - never guessed

That is the Track 04 bar - and SettleMatch is designed around it.

Three layers

1. Rules engine

Clear cases first (UTR, amount + date window).

2. AI matcher

Only leftovers and messy narration cases.

3. Confidence gate

Low confidence becomes an exception - not an auto-approve.

"Smart + safe."

06 | Key Features

- Batch reconciliation on 100 synthetic records
- Dual matching: Rules + AI
- Confidence threshold (0.85)
- Honest exception list with reasons
- Full audit log of every decision
- Live dashboard for demos
- Eval metrics against ground truth
- Gemini-ready; offline heuristic fallback for demos

07 | Demo Flow

- Load settlement + bank data
- Click Run reconciliation
- See match rate, rupees matched, rule vs AI split
- Review exceptions with reasons
- Open audit trail - every decision explained

Ideal for a 5-minute pitch video: problem -> live run -> metrics -> refuse case.

08 | Results (Sample Batch)

On a batch of 100 settlements:

90% Match rate	75 / 15 Rule / AI	10 Exceptions	87% Recovery
--------------------------------------	---	-------------------------------------	------------------------------------

90% of rows closed, about 87% of rupees recovered, 10 leftovers left for a human. Not a 100% scorecard.

09 | Why This Wins Track 04

The track asks for:

- Throughput on a real batch
- Measured accuracy
- An honest exception list

SettleMatch delivers all three - not a chatbot wrapper.

10 | Why Razorpay

- Settlements
- Merchant money movement
- Finance operations
- Trust and auditability in payments

Looks like real Razorpay work - not a generic AI toy.

11 | Safety and Trust

- AI cannot invent bank IDs outside the candidate list
- Already-used bank rows cannot be rematched
- Below-threshold suggestions are refused
- Every accept / refuse is logged

"Failure mode shown: graceful refuse."

12 | Who It Is For

- Merchant finance teams
- Ops / reconciliation analysts
- Future: Razorpay internal finance tooling

Internship angle: a builder who ships bounded AI systems - not someone who only prompts models.

13 | What Is Next

- Live Razorpay settlement APIs
- Multi-account / multi-currency support
- Human-in-the-loop review queue
- Production dashboards and alerts

SettleMatch does not just find matches.

It closes the books - with proof.

"Rules first. AI second. Gate always."

30-second spoken version

SettleMatch is an AI finance controller. It reconciles Razorpay settlements with bank credits. Clear cases are matched by rules, messy cases by AI, and anything uncertain is refused with an audit trail. On 100 records we hit 90% match, about 87% rupee recovery, and 10 leftovers for a human.
